

[METHOD AND APPARATUS FOR PROCESSING DOCUMENT SERVICE REQUESTS ORIGINATING FROM A MOBILE COMPUTING DEVICE]

Abstract of Disclosure

A document service request is processed that originates from a mobile computing device and that is directed at an output device in communication with the mobile computing device over a first communications channel of the mobile computing device. A document server communicates with a transceiver to receive over a second communications channel a document service request originating from the mobile computing device. The document service request includes a first parameter identifying a document available to the document server and a second parameter identifying a type of output device available over the first communications channel. The document server transmits to the output device, via the second communications channel established by the mobile computing device, the document rendered in a format suitable for the output device.
